3 Updated sensitivities of Solvency 2 ratio as of 31 Dec 2020

Estimation of stress impact¹

Comments

Decline in credit spread sensitivity reflects:

- positive effects from model changes
- high quality investment portfolio

¹ Estimated solvency ratio changes in case of stress scenarios (stress applied on both Eligible Own Funds and capital requirement, approximation for loss absorbing capacity of deferred taxes)

² Interest rate stresses based on non-parallel shifts of the interest rate curve based on EIOPA approach

³ The credit spreads are calculated as spreads over the swap curve (credit spread stresses include simultaneous stress on government bonds)

Overall moderate sensitivity to various stress scenarios – above target range for most sensitivities
